TITLE: The Control Method and the Scale of Carbide Heterogeneity in Highly Alloyed Chromium Tool Steels (Metodika kontrolya i shkala karbidnoy neodnorodnosti vysokokhromistykh instrumental'nykh staley)

PERIODICAL: Zavodskaya Laboratoriya, 1957, Vol. 23, Nr 9, pp. 1088-1091 (USSR)

ABSTRACT: A special scale for controlling carbide heterogeneities in a highly carbonized and highly alloyed chromium steel is worked out. For this purpose samples from 184 melts of the "Elektrostal'" plant, which were rolled up to from 10 to 200 mm, were investigated, First evaluation of carbide heterogeneities was carried out according to the scale of the GOST 5952-51. It is shown that with an increase of the diameter of the rolling material, i.e. with a reduction of the degree of buckling, the characteristic value of the carbide heterogeneity becomes greater. Investigation of the microstructure showed that the character of carbide distribution is the same in all investigated types of steel, in dependence on the degree of buckling. However, the size of the carbide particles is considerably larger in Kh 12 steel than in Kh 12 m, Kh 12 F and Kh 12 F 1 steel. The scale shows the carbide heterogeneity of the rolling material from 10 to 160 mm. The basic characteristic feature of the micro-

Card 1/2

structure distribution according to characteristic values is the character of the eutectic carbides, which, in turn, depend on the degree of buckling in rolling or forging. The control method for heterogeneities according to the scale mentioned is described. There are 3 figures and 2 tables.

TITLE: 8.5-Bev proton-proton scattering

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 41,
no. 6(12), 1961, 1748-1756

TEXT: Continuing previous work (V. B. Lyubimov et al. ZhETF, 37, 910, 1959; P. K. Markov et al. ZhETF, 38, 1471, 1960) the authors studied elastic proton-proton scattering at energies of 8.5 Bev, using photographic emulsions of the ММКМ-5P (NIKFI-BR) type. The primary proton beam of $(2.01 \pm 0.05) \cdot 10^5$ particles/cm² (from the proton synchrotron of the Joint Institute of Nuclear Research) struck the emulsion perpendicularly. The emulsion contained $(2.90 \pm 0.06) \cdot 10^{22}$ hydrogen atoms per cm³. 354 elastic scattering events (plus 145 of previous work) were found. The elastic scattering cross section was 8.74 ± 0.40 millibarns. Conclusions: (1) The mean square p-p interaction radius is

TITLE: Determination of decarburization in bright-drawn high-speed steel by the thermoelectric potential method

SOURCE: Zavodskaya laboratoriya, v. 32, no. 6, 1966, 719-720

TOPIC TAGS: thermoelectric sensor, decarburization, high speed steel, carbon steel/ R9 tool steel, R18 tool steel

ABSTRACT: A method for determining decarburization in bright-drawn high-speed steel is briefly described. The method is based on measuring the thermoelectric potential between the metal surface and a copper electrode clamped to the surface, and by comparing this potential with the potential obtained between couples of known composition. Experiments were performed on steels R9, R18, and others (not listed in report) using a copper electrode at 160--170C (some results are tabulated). The decarburization criterion is specified by GOST 5952-63 as <0.7% carbon in the surface layer for steel R18 and <0.85% for steel R9. It was found that a meter reading of >7 (unspecified scale) indicated decarburization in 72--100% of the specimens (checked by chemical analysis). It was concluded that this method is sufficiently sensitive to carbon content in the surface layer to be of practical importance. Orig. art. has: 1 figure and 1 table.

SOURCE: Izobreteniya, promyshlennyye obratzsy, tovarnyye znaki, no. 4, 1966, 149

TOPIC TAGS: insulating material, thermal insulation

ABSTRACT: This Author Certificate presents a method for producing thermal insulating materials from a mixture of magnesium trihydrocarbonate and asbestos heat-treated at 120--150C. To increase the degree of thermal stability of the material and to decrease its density, the mixture of magnesium trihydrocarbonate and asbestos (after the heat treatment) is subjected to additional baking at 550--600C for 4--6 hours.

"Problem of Poliomyelitis in the USSR," N. V. Konova-
lov, L. M. Popova

"Pediatriya" No 4, pp 5-14

Current article lays claim to the effect that Soviet
scientists Chumakov, Voroshilova, and Levkovich iso-
lated 2 distinctive polio-carrying viruses, patho-
genic to humans, monkeys, and certain rodents. Dis-
carding "Western Theories," authors elaborate on the
Pavlov theory of influence of the environment on a
human organism, state that recent research and expts
have conclusively demonstrated that pathological
changes of the central nervous system in polio

22J734

Infection are not limited to the spinal cord but af-
fect the cerebral cortex as well, and assert that
entry of the polio virus into the human body has been
experimentally proven to take place through the gas-
trointestinal and respiratory tracts. Disclaiming
epidemic proportions of polio in the USSR, the authors
admit that poliomyelitis ranks 1st on the list of
virus-caused crippling diseases of children in the
USSR. Describe the use of sera, gamma globulin,
dibasol, and proserine in the therapy of polio.

"Sense of Smell in Tick-Borne Encephalitis,"
A. M. Shapoval, I. M. Popova, Chair of Nerve Diseases, MII Med Acad Imeni S. M. Kirov and Inst of Neurol, Acad Med Sci USSR

"Zhur Nevropatol i Psikhiat" Vol 52, No 6, pp 58-60

Describes research on the effects of tick-borne encephalitis on the sense of smell. Expts conducted according to Usberg and Lewi's system revealed that, in cases of epidemic or recently contracted encephalitis, the threshold of

234742

sensibility was increased up to a state of anosmia, becoming hyperosmia in chronic stages of the disease. Pronounced inflammatory and degenerative changes were observed in the 2d and 3d neurons of the olfactory receptor. Authors believe that a total lack of smell observed in the acute stages of the disease is gradually recovered with convalescence, and remains as a residual defect only in rare cases.

(Poliomyelitis)

Detailed description of the results of a microscopic examination of brain specimens obtained from children and monkeys who died of poliomyelitis. Authors state that oxyphilic inclusions were observed in the cytoplasm and nucleus of affected nerve cells. The occlusions differed from those observed in herpes and tick-borne encephalitis in size and structure and showed a characteristic change of the nucleus containing the occlusions. In contrast to Negri bodies found in rabies of dogs, the polio intranuclear occlusions show a positive reaction for thymonucleic acid. 256T61

✓ The distribution of nucleic acids in the nerve cells of the frontal horn of the spinal cord in acute poliomyelitis. *I. M. Popova* (Inst. Neurol., Acad. Med. Sci. U.S.S.R., Moscow). *Arkh. Patol.* 19, No. 2, 20-34 (1957). — The content of nucleic acids in the nerve cells of the frontal, cerebrospinal horn changes during the paralytic period of acute poliomyelitis; these changes differ in intensity with the time elapsed from the onset of the paralytic manifestations. During the first 2 days, in the case of man, and up to the 4-5th day in the case of monkeys some increase in the size and no. of the deoxyribonucleic acid (DNA) granules can be observed. After the 8th day of the paralytic period the content of the DNA of the nerve cells returned to its normal level. The ribonucleic acid (RNA) of the cytoplasm of the nerve cells was visibly reduced between the 1st and the 7th day of the paralytic period; the same was true for the content of the RNA of the nucleolus, though to a lesser degree. The content of the cytoplasm of the nerve cells increased after the 7th day in the case of monkeys and after the 9th day in the case of man. In poliomyelitis in man the basophilic inclusions of the nuclei contained RNA, but the reaction for DNA was neg. *B. S. Levin*

TITLE: Preparation of alkylaryl esters of pyrocatechol phosphorous acid as stabilizers of polymer materials

SOURCE: Khimicheskaya promyshlennost', no. 2, 1965, 20-21

TOPIC TERMS: alkylaryl ester, pyrocatechol, phosphorous, acid, thermostabilization
ABSTRACT: A description of a two-step synthesis of alkylaryl esters, which may become the basis for the industrial production of nonstaining thermostabilizers of polymers, is given and shown by

Side reactions result in the formation of diphosphite compounds. In the first step, to 1 mol of pyrocatechol, 2.1 mol of phosphorous trichloride are added through a period of 15 - 20 min. In the second step, to 1 mol of pyrocatechol, 1.5 mol of phosphorous trichloride are added through a period of 15 - 20 min. Card 1/2

L 33333-65

ACCESSION NR: AP5005156

minutes. The temperature is gradually brought to 90C through 6-7 hours, and to 140C in 2 hours. It is kept there for 10-11 hours. The products of reaction are then distilled. Presence of water during the reaction is beneficial. The second esterification step with phenols or naphthols is performed in inert solvents or without them in enameled steel reactors. The process involves stirring and heating to 120C under bubbling nitrogen. Orig. art. has: 3 figures and 1 formula.

TITLE: Synthesis of alkyl(dialkyl)pyrocatecholphosphites

SOURCE: Zhurnal obshchey khimii, v. 36, no. 6, 1966, 1143-1147

TOPIC TAGS: organic synthetic process, organic phosphorus compound

ABSTRACT: A series of alkyl- and dialkylpyrocatecholchlorophosphites, as well as esters of substituted pyrocatecholphosphorous acids, were synthesized and described for the first time. The esters of alkylpyrocatecholphosphorous acid were produced by reaction of alkylpyrocatecholmonochlorophosphite with various alcohols and phenols. The starting materials were synthesized by alkylation of monohydric phenols; optimum conditions, ensuring high yields of 3,5-ditert-butyl- and 3,5-diter-amylypyrocatechol were found. AUTHOR: Popova, L. M.

TITLE: Pathogenesis and treatment of respiratory disturbances in intoxication by organophosphorus insectofungicides (thiophos)

SOURCE: Zhurnal nevropatologii i psikiatrii, v. 64, no. 9, 1964, 1316-1321

TOPIC TAGS: fungicide, biologic ecology, nervous system, toxicology, poison effect

Abstract: Thiophos is a neurotropic poison, with a strongly pronounced muscarine-like action. Human can be poisoned by this chemical by inhaling it while working with farm crops, during industrial production, and in accidental ingestion. Thiophos causes generalized damage to the nervous system with the chief harm done to functions of the brainstem sections. The process resembles toxic encephalopathy or meningo-encephalopathy. In Soviet literature, the clinical aspects and pathogenesis of respiratory disturbances in thiophos poisonings, and also the methods of treating respiratory disorders are scarcely dealt with. This report presents material on these problems. Changes in the acid base equilibrium

Card 1/2

L 54825-65

ACCESSION NR: AP5017952

in the thiophos poisoning patient are analyzed. From the study made of one poisoning case, it can be concluded that prominent in the pathogenesis of respiratory disturbances in thiophos poisoning is disruption in the mechanisms of central respiratory control, which develop only while the patient is unconscious and, probably, are caused by severe suppression of the cortical functions. Direct damage to the respiratory center in thiophos poisoning probably does not occur. This is evidenced by the response of the respiratory center to hyperventilation. It can be observed that hypocapnia ($pCO_2 = 26-68$ mm Hg) and respiratory alkalosis ($pH = 7.48-7.52$), produced by using hyperventilation, results in a suppression of the respiratory center functions and an inhibition in respiration itself, as usually is observed in the normal state. We employed this response of the respiratory center to eliminate the specifically inadequate respiration of the patient and replace it by the more precisely metered respiration. Orig. art. has 1 table.

POPOVA, L.M.

A semigroup of partial endomorphisms of a set with a relation.
Uch.zap.Ped.inst.Gerts. 238:49-77 '62. (MIRA 16:4)
(Groups, Theory of) (Aggregates)

POPOVA, L.M.

Determining correlations of a semigroup of partial endomorphisms
of a finite linearly ordered set. Uch.zap.Ped.inst.Gerts.
238:78-88 '62. (MIRA 16:4)
(Groups, Theory of) (Aggregates)

POPOV, V.V.; POPOVA, L.M.

Optimal reflux-to-product ratio during rectification. Khim.
i tekhn. topl. i masel 8 no.10:1-3 0 '63. (MIRA 16:11)
